Any event must be carefully managed and coordinated between numerous organizers in order to be successful. In written manual records, a major issue is a lack of communication and the lack of updated participant records. Managing many events at the same time will simply add to the difficulty. Our project intends to simplify this by incorporating cutting-edge computer science technology.

End-to-End event management system is the management of events which consists of the creation, development and updating of small and/or large-scale personal or corporate events. Our project explains how to use a web-based interface to manage an event. The primary goal of creating an event management interface is to provide the institution with a single application that will aid in the organization and management of all events. The outcome of this project is a simple and unified interface for managing and monitoring event progress on the move, to smoothly perform the entire event, and to keep all events digitized.

The interface of our website will provide options for a relatively easy data input text-boxes that will be properly labeled. It will also have a user-friendly view of the whole system with simple and easy undertaking of action-driven processes as command buttons are functionally labeled. With all these, target users of this website will relatively won't find it difficult to use it.

Our application makes it simple to organize an event and manage it, as well as track progress on the go, a completely seamless event on the go. Data from participants and events are better visualized on the dashboard. All Integrated judgement within the web app has an automated certificate. Overall, this application minimizes the amount of extra work that event organizers have to do when administering a large-scale event.
